HabbitQuest — Executive Brief for the CEO & CTO

Nov 3, 2026 · @Rahul

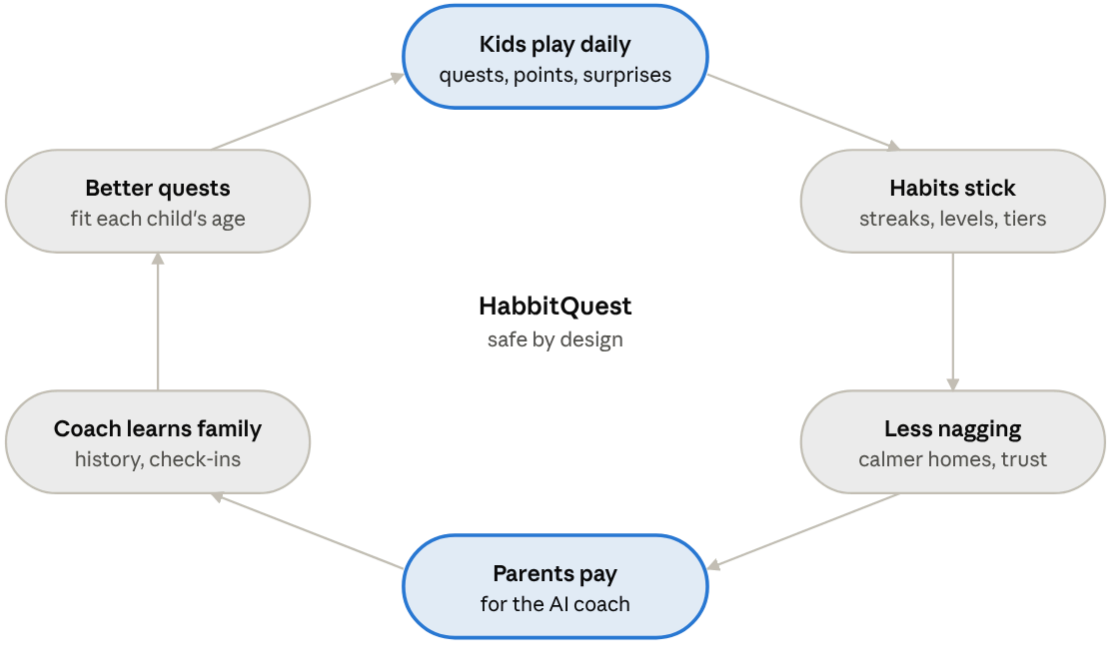

The pitch in one page

HabbitQuest is the only kids' habit app that pairs a game children love with an AI coach parents can trust. A parent describes a problem in plain words; the coach answers with cited, age-fit advice and new quests; the child plays them for points, levels and surprises; and nothing changes without the parent's PIN.

- **For whom:** families with children aged 3 to 13, starting with English-speaking markets.
- **Why it wins:** competitors are either games without guidance (Joon, Habitica), money apps with chores bolted on (Greenlight, BusyKid), or screen-time controls (OurPact). None coaches the parent.
- **Why now:** open-weight models on low-cost inference make a safe coach cost about a fifth of a cent per conversation turn (estimate, section 7).
- **Proof:** a working product: the web app and API with cloud accounts, Google sign-in, several grown-ups per family and kids on their own devices; 383 backend tests at 100% coverage, 67 frontend tests and 2 browser tests run on every change.

The flywheel: kids play, habits stick, parents pay for the coach

Each turn makes the next one stronger

business flywheel · 6 stages

The free game drives daily use; the paid coach turns that use into revenue and better advice.

Market opportunity and the parent problem

Parents already pay monthly for help with kids' routines, money and screens, but they buy three separate apps and still get no advice on what to change.

Evidence that parents pay (sources in section 5):

- A habit game for kids with ADHD, Joon, charges $12.99 a month or from $89.99 a year.
- Greenlight's family plans, which include chores and allowance, run from $5.99 to $19.98 a month.
- OurPact screen-time control lists $6.99 and $9.99 tiers.
- Goally sells a routines tablet for kids aged 2 to 8 at $295.

The problem behind the spend

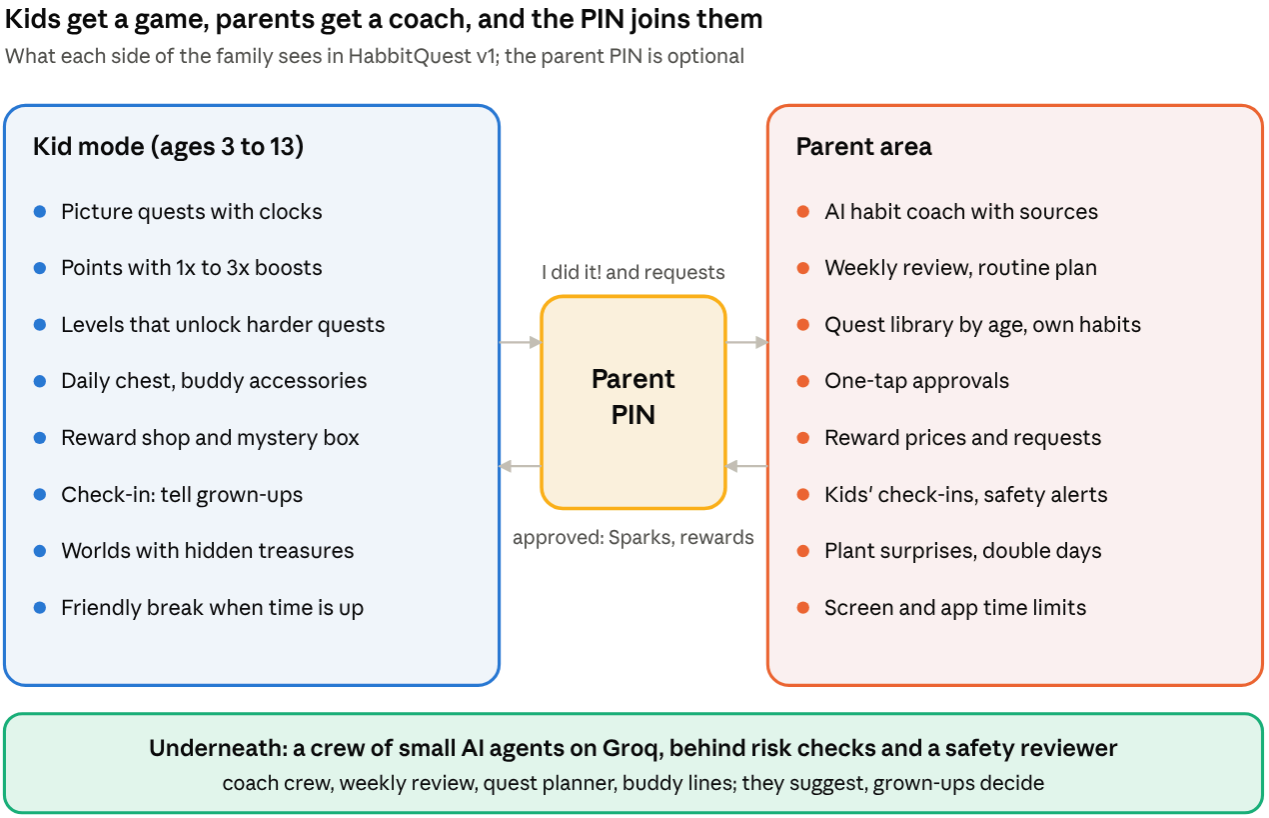

What parents say	What they get today	The gap
"I nag all day"	Chore charts and reminder apps	Kids are not motivated beyond the first weeks

What parents say	What they get today	The gap
"I don't know what to try"	Forums, blogs, generic chatbots	No age-fit, cited advice tied to their own child's week
"Screen time ends in tears"	Blocking tools	Blocking without building the habit of switching off
"My child won't tell me what's hard"	Nothing	No channel for the child's voice

Market sizing is not yet researched for this brief; the next step is a sized market model (households with children 3 to 13 in target countries, times paid conversion).

The product

HabbitQuest is one app with two faces on one device: a picture-first game for the child and a calm control centre for the parent.

product map · kid mode, parent area, PIN, AI layer

A day with HabbitQuest

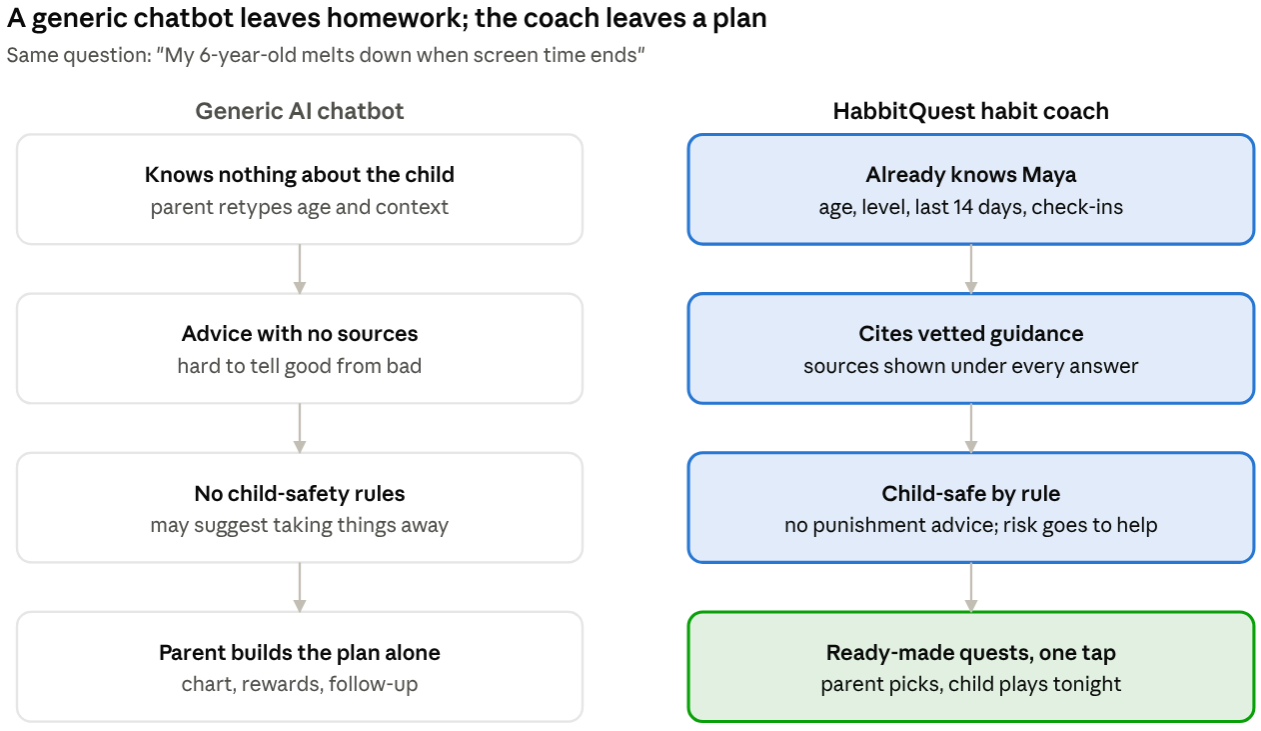

1. 7:00 Maya's buddy (a bunny wearing the crown she won) greets her; today's golden quest is worth double.

2. She taps "I did it!" on wake-up and homework; her parent approves both with one tap (and the family PIN, if they set one).
3. A sparkle celebration shows +40 points and "Sky Islands reached: tier 3 quests unlocked."
4. After dinner she opens her treasure chest, then spends 60 points on "+15 minutes screen time"; her parent says yes.
5. At bedtime she sends a check-in: mood "tricky", trickiest quest "Bed builder", sticker "Can we do it together?"
6. Her parent tells the coach "Maya struggles making her bed"; the coach cites guidance and suggests an easier tier 1 quest.

Every feature in this brief is built and running in the prototype today.

Why AI plus safety is the differentiator

Parents can already ask any chatbot for parenting tips; what they cannot get is advice that knows their child, shows its sources, is safe for children by rule, and turns into a plan the child actually plays.

generic chatbot vs habit coach · same question

Trust is the moat. For a kids' product, the safety story is a sales feature, not just compliance:

- AI only suggests; every change waits for a grown-up to accept it (with the family PIN, if set).
- Everything a child reads or writes passes two checks; signs a child may be unsafe reach the parent, not the AI.
- Every parent message gets two risk checks (word lists, then a safety model) before any coach sees it, and a safety reviewer checks every reply; if the reviewer fails, the reply is not shown.
- The AI sees first names, ages and quests only, never emails or passwords.

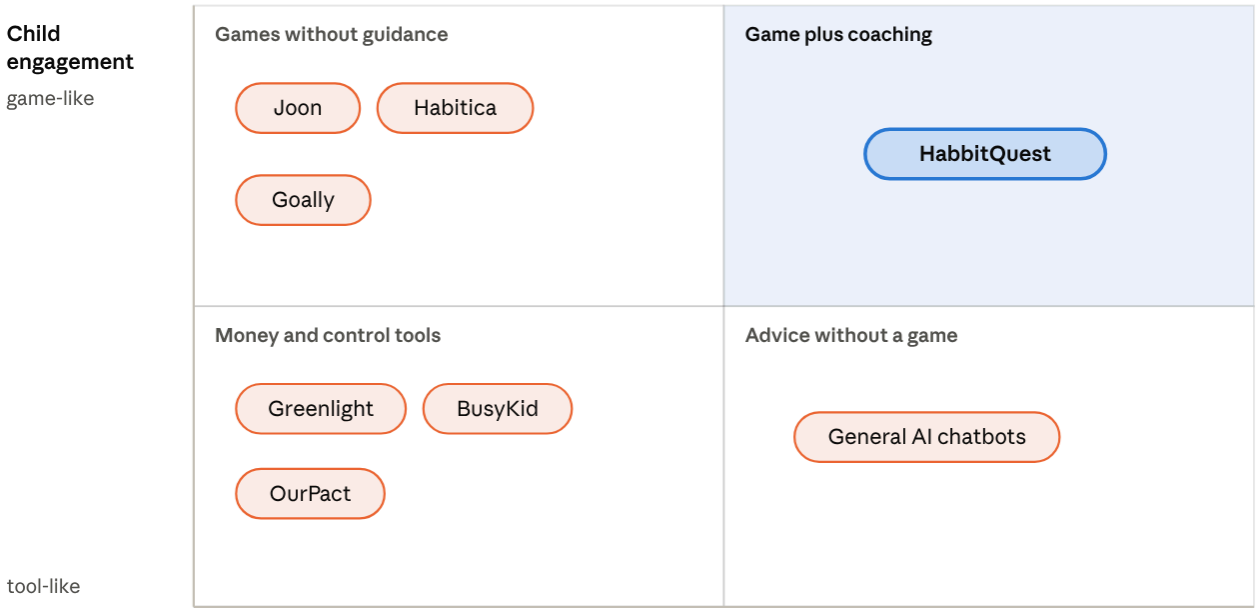

These controls are built and tested today, which shortens the path to a school, clinic or app-store "kids" listing.

Competitive landscape

Competitors split into games without guidance, money and control tools, and general chatbots; none combines a kids' game, parent coaching and child-safety rules.

HabbitQuest is alone where a kids' game meets parent coaching

Market map from public listings, October 2026 (zones, not scores)

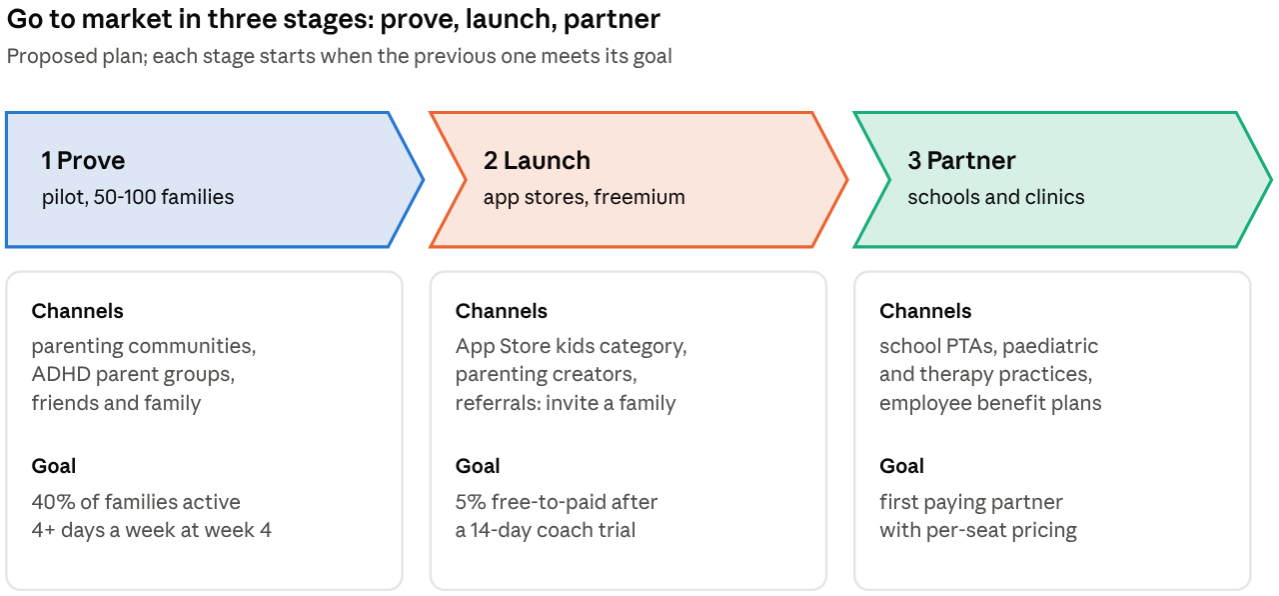

market map · 7 alternatives and HabbitQuest

Product	What it is	Ages	Price as listed	Game for kids	AI coaching for parents	Real-world rewards	Screen-time control
HabbitQuest	Habit quests + AI habit coach	3-13	Free game; coach plan proposed at $4.99/mo	Yes: points, levels, worlds, chests, surprises	Yes, cited and child-specific	Yes, parent-priced shop	Kid-mode limit and screen goal
Joon	ADHD routines game with a virtual pet	6-12	Free plan; $12.99/mo or from $89.99/yr	Yes, virtual pet	Not listed; AI can review quest submissions (App Store)	In-game rewards	Not listed
Habitica	Gamified to-do RPG	Rated 13+	Free; $4.99/mo, $47.99/yr	RPG, not built for young kids	Not listed	Self-set rewards	Not listed
Greenlight	Kids' debit card, chores and allowance	Kids and teens	$5.99-$19.98/mo per family	No	Not listed	Real money	Not listed
BusyKid	Chores, allowance, saving, investing	Kids	Subscription; price not shown on site	No	Not listed	Real money	Not listed
OurPact	Parental controls and location	Families	$6.99 and $9.99 tiers; $69.99 and $99.99 options	No	Not listed	No	Yes: schedules, blocking
Goally	Routines tablet and apps	2-8	$295 system, apps free for 6 months	Visual routines and points	Not listed	Points and rewards	Curated device

Prices and features come from each company's site or App Store listing, read on 29-30 October 2026; App Store listings don't say which price is monthly or yearly unless stated. "Not listed" means the public listing doesn't mention it.

Positioning, go-to-market and pricing

Positioning: for parents of children aged 3 to 13 who are tired of nagging, HabbitQuest is the habit game with a built-in AI coach that turns any problem into quests your child wants to do, safely and with you in control. Unlike chore or money apps, it tells you what to try and why.

go-to-market · 3 stages with channels and goals

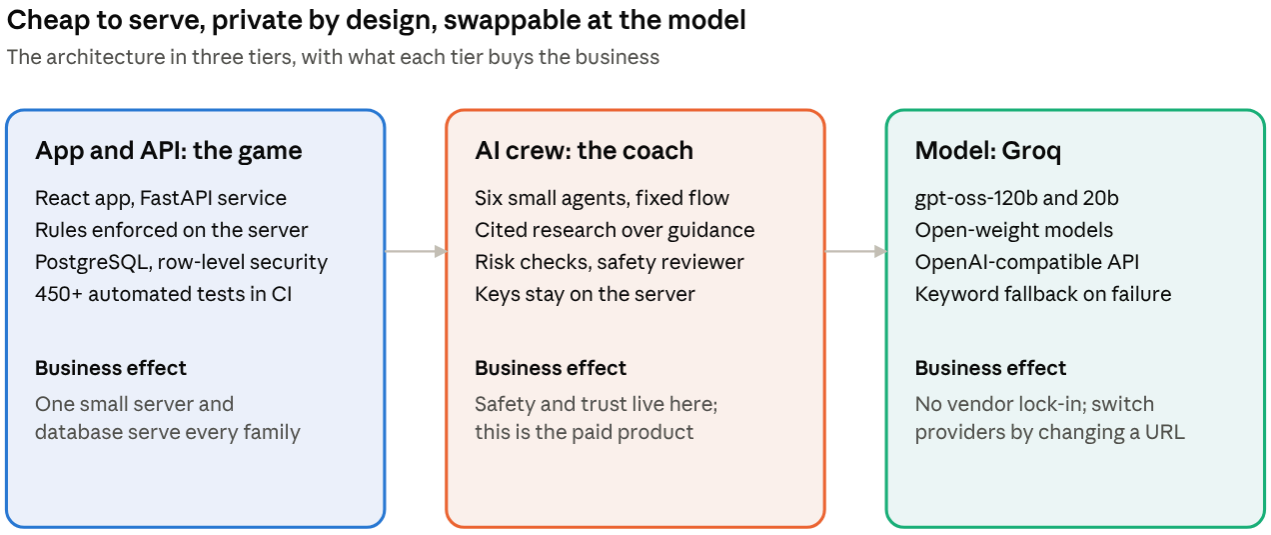

Pricing (proposed, to test in the pilot)

Plan	Includes	Price
Free	The full quest game, approvals, points, levels, reward shop, chests, check-ins, time limits; up to 2 children	$0
Family Plus	Everything free, plus the AI habit coach, weekly review, routine planner, buddy lines, unlimited children	$4.99/month or $39.99/year
Partners (later)	Dashboards for schools or practices	Per seat, to be decided

At $4.99 a month, Family Plus sits below Joon ($12.99) and OurPact Premium ($6.99), and at Habitica's entry price, while offering the only parent coach in the set.

For the CTO: architecture, cost and moat

The expensive part (AI) is small, server-side and swappable; the game and every family's data run on one small API and database, so each family costs very little to serve.

architecture for the CTO · 3 tiers and their business effect

AI cost per family (estimate)

Item	Assumption	Monthly cost
Coach	20 turns a month; each turn is a crew of 6 small agents plus a risk check, most tokens on the planner (about 3,000 a turn on gpt-oss-120b); to be measured in the pilot	about $0.04
Weekly review and plan	8 JSON calls a month on gpt-oss-120b	about $0.01
Buddy lines and safety checks	about 120 short calls a month on gpt-oss-20b	about $0.02
Total		**under $0.10**

Based on Groq's gpt-oss-120b price of $0.15 per million input tokens and $0.60 per million output tokens (ComputePrices, updated 28 October 2026); token counts are estimates from the prototype's prompts, to be measured in the pilot. At $4.99 a month, AI is under 2% of revenue; app-store fees (15-30%) are the larger cost.

Scalability: the API is stateless and scales horizontally; PostgreSQL holds all family data, with row-level security so one family can never read another's. The binding constraints today are Groq's free tier (about two coach turns a minute) and the free hosted database,

which expires on 28 November 2026; paid tiers remove both.

Technical moat: a curated, citable knowledge base and quest library mapped to ages and tiers; a coach that sees the child's real history; guardrails and parent-approval architecture proven in code; and a family-data model built for a kids' product from day one.

Risks and mitigations

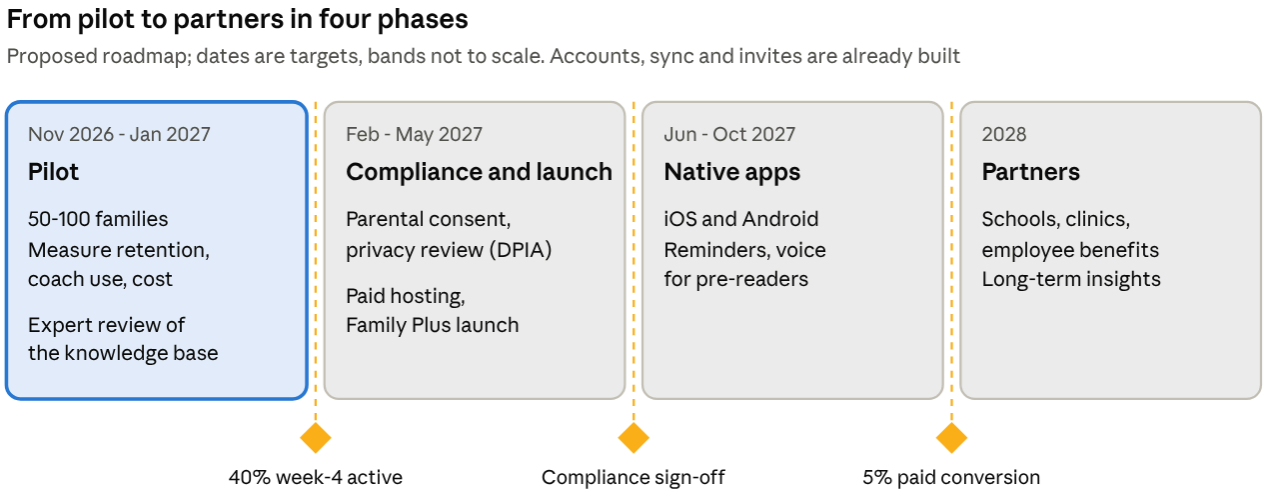

The two risks that could stop the business are children's privacy compliance and a safety incident; both have controls in the product today and a clear plan to finish them.

Risk	Why it matters	Mitigation
Children's privacy (COPPA, GDPR-K, UK Children's Code)	Fines and app-store removal	Data minimisation built in; verifiable parental consent, deletion and a DPIA before launch
Unsafe AI content reaches a child	Reputation-ending	Word lists and a safety model on every message, a safety reviewer that fails closed, fail-closed buddy lines, parent alerts; red-team testing planned
Coach advice seen as medical advice	Liability	Curated, cited guidance; no diagnosis rule; professional review of the knowledge base
Retention fades after novelty	Weak conversion	Levels, tiers, daily surprises, parent-planted surprises; pilot measures week-4 activity
Large players add AI (for example Joon, Greenlight)	Feature parity	Lead on trust and child-specific coaching; build partner channel early
AI provider limits or price changes	Margin and uptime	OpenAI-compatible client with Groq and Nebius presets, so switching is a settings change; keyword fallback when a model fails

Risk	Why it matters	Mitigation
Free hosting tiers	The free database expires on 28 November 2026 and the API sleeps when idle	Paid database and always-on API before the pilot (cloud accounts and sync are already built)

Roadmap, milestones and the ask

The next step is a three-month pilot with 50 to 100 families; everything after it is gated on what the pilot proves. Cloud accounts, sync across devices, co-parent invites, kid sign-in by family code, and family export and deletion were planned for phase 2 and are already built.

roadmap · 4 phases, 3 gates

The ask

1. **Approve the pilot** (November 2026 to January 2027) with the success measures in Doc1: 40% of families active 4+ days a week at week 4, and zero unsafe AI text shown to a child.
2. **Fund a small team** for the pilot and the cloud phase: one full-stack engineer, part-time design, a child-development advisor to review the knowledge base, and privacy counsel for COPPA and GDPR-K. Budget to be sized.
3. **Move to a Groq paid tier** and a paid database before the pilot, so families never hit rate limits and no data is lost when the free database expires on 28 November 2026.
4. **Decide pricing and first market:** confirm Family Plus at $4.99 a month (or test two price points) and the launch country.
